

Chapter 1

User Interfaces Design

In this chapter are shown the main mockups of myTaxiService, due to present the graphical user interfaces of the system for each functionality. All the mock-ups are displayed with an accurate description to prevent misunderstanding and to recall the functionality.

1.1 Registration/Login

When an user connects to the WS or opens the MA, the first screens is the login page. For both the versions, there is a button to redirect to the registration page, if the user is not registered yet.

The figure ?? is the WS version where the registration button is not visible in this mockup for a simple reason: at the initial page there are only the logo and two button, login and register. After a click on login button the displayed screen is shown by the system.

The figure ?? is the corresponding mockup for the mobile application: at the application opening the user can inserts his credentials or clicks on the registration button.

Figure 1.1: Login page into website.

Figure 1.2: Login page into mobile application.

A non registered user has to enrol into the system, so he clicks on the corresponding button and he is redirected to that page. The figure ?? and ?? shows the mockups for this: into the MA the box labels are written into them and disappears when the user fills in; into the WS the labels are shown near the corresponding one.
